CORPORATE PROFILE

Analog Devices, Inc. designs, manufactures and markets high performance linear and mixed-signal integrated circuits (ICs). These devices are used to condition, amplify and otherwise process analog signals from sensors that measure real-world phenomena such as temperature, pressure and velocity and convert those signals into a digital form that can be read by a microprocessor or computer.

The company's products also include digital ICs used in digital signal processing applications, which typically involve the further processing of real-world information after conversion to digital form. Other products include signal processing components manufactured using assembled product technology and a limited number of board-level subsystem products.

Most of Analog Devices' sales are made to original equipment manufacturers (OEMs) who incorporate Analog's products in a wide variety of end products. The company's served markets include laboratory and industrial automation, military/aerospace, telecommunications, computer peripherals, high-end consumer products and automotive/transportation.

Analog's products are sold through direct sales offices located throughout the United States and in 14 other countries. The company's products are also sold by sales representatives operating from more than 50 offices in the U.S. and around the world and by industrial distributors.

Founded in 1965, Analog Devices employs approximately 5,200 people worldwide. The company has manufacturing facilities in Massachusetts, California, North Carolina, Ireland, Japan, the Philippines and Taiwan. Analog Devices' stock is traded on the New York Stock Exchange under the symbol ADI.

MODEL NUMBERING

Two model numbering schemes are used by Analog Devices. The first model numbering scheme is used for designating standard Analog Devices monolithic and hybrid products. The second scheme is used by our Precision Monolithics Division (formerly PMI) as designators for its product line.

Figure 1 shows the form of model number used for our standard monolithic ICs and many of our hybrids. It consists of an "AD" (Analog Devices) prefix, a 3-to-5-digit number, an alphabetic performance/temperature range designator and a package designator.

Figure 2 shows a different numbering scheme used by our Precision Monolithics Division. This numbering scheme starts with a prefix which designates the device type and model number. It is then followed by a suffix consisting of alphabetic designators (as applicable) to indicate additional functional designations or options and packaging options.

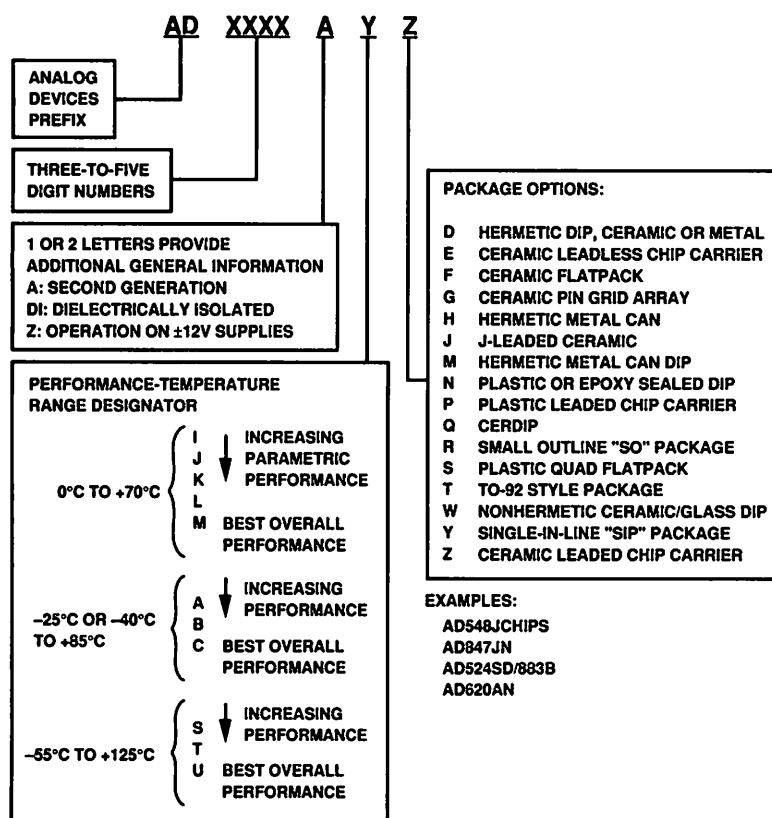

Figure 1. Model Number Designations for Standard Analog Devices Monolithic and Hybrid IC Products. S, T and U Grades have the Added Suffix, /883B for Devices that Qualify to the Latest Revision of MIL-STD-883, Level B.

STANDARD MILITARY DRAWINGS

Analog Devices offers compliant 883C products tested to military drawing requirement. These products are all produced in facilities which are fully qualified to MIL-M-38510 for integrated circuits, or MIL-STD-1772 for hybrids. Those devices currently available are listed in the table below. New devices are being added to the military drawing system as program needs are identified. If your program has a use for products which are currently on this list, ADI will assist you in preparing a military drawing for your requirement. Please call ADI direct for assistance.
